

Combination of Biological Substances, Albumin-Carrier Therapy with Low-Dose Chemotherapy and Insulin

Dr. Reinhard Probst, MD

Practice for Naturopathy, Homeopathy, Acupuncture, Chirotherapy, Hyperthermia of Dr. Reinhard Probst, Munich, Germany

Introduction:

After years of testing and experimenting with progressed stages of cancer Dr. Reinhard Probst has found a combination of therapies that can at least control progressed stages of cancer.

Albumin carrier therapy destroys the matrix of the tumor. 30 years ago, the biochemist Dr. Sinn at the German Cancer Research Center had the idea to attach the chemo agent methotrexate (MTX) to the carrier protein albumin. Because albumin is a transportation protein it will not be broken down by healthy tissue because it is too important to use it as a source of nourishment. Inflamed or cancer tissue destroys the albumin to use it for their nutrition and the MTX will be released. This makes the tumor cells extremely sensitive to other attacks like

1. Curcumin: Single substance of the turmeric plant (*curcuma longa*) that interacts with more than 100 metabolic pathways of the tumor cell.
2. Insulin potentiation therapy: Low-dose chemotherapy that is augmented by insulin and also by curcumin.
3. Other biological substances like amygdalin, vitamin C, artesunate and dca.
4. Hyperthermia
